

Sungsan E&C

World Leader in RF Amplifier solution

Company Introduction

INTRODUCTION

Sungsan E&C - Export-oriented Company

"Sungsan can design and develop amplifiers of the frequency range you want from several MHz to two-digit GHz."

Since its establishment in 2001, Sungsan has been developing and exporting broadband amplifiers using GaN device and linear HPAs using several linearization technologies such as Analog predistortion and feedforward. Sungsan has been developing its amplifiers through their systematic and innovative technology development and know-how they accumulated over the years and has been trying to extend the application of its amplifiers to defense, industry, space, communication and medical equipment, paving the road to becoming the global leader. Since 2010, in an effort to shift their focus from amplifier modules to amplifier systems, Sungsan has been successfully proposing broadband high power amplifier solutions for EMC lab testing and for heavy-ion accelerator fields.

APPLICATION FIELDS

► Radar, EMC Testing, Accelerator

► Repeater, DAS, Base Station

Special
Purpose
Amplifier

Linear
Amplifier

General
Boosting
Amplifier

► Jamming, UAV, Interception

STRENGTHS

Various solutions

Through the years-long experience in the RF field, Sungsan can propose not only signal-boosting amplifiers but also bespoke RF systems designed to meet each customer's specific signal source requirements.

Optimized bespoke solutions

Sungsan's experienced engineers can propose HPA or system solutions of the shape and high performance their customers want for their successful projects.

High quality

Sungsan has proved their unrivaled quality through exporting to overseas defense industries for many years. Sungsan can and will keep your quality level as high as you want.

MAIN PRODUCTS

General High Power Amplifier

- Jamming Amplifier
- Broadband High Power Amplifier

Linear Amplifier

- Analog Pre-Distortion Amplifier
- FeedForward Amplifier
- Adaptive Bias Control Amplifier

Special Purpose System

- Amplifier system for heavy-ion accelerator
- Amplifier system for EMC lab testing
- Amplifier system for Radar
- Amplifier system for RF Burning & Testing

General High Power Amplifier

GENERAL DESCRIPTION

1. Characteristics

The General high power amplifier amplifies small RF weak signal to the output power level customers want. Sungsan has an amplifier lineup from 1MHz to 11GHz and it includes not only normal boosting amplifier modules but also the special-purpose broadband HPA which covers several frequency ranges with only one PA module.

2. Main Features

- Reverse voltage protection circuit
- Forward & Reverse Monitoring (option)
- Current Monitoring
- Over temp shutdown or Degradation
- Fast Shutdown
- Voltage Variable Attenuator (option)

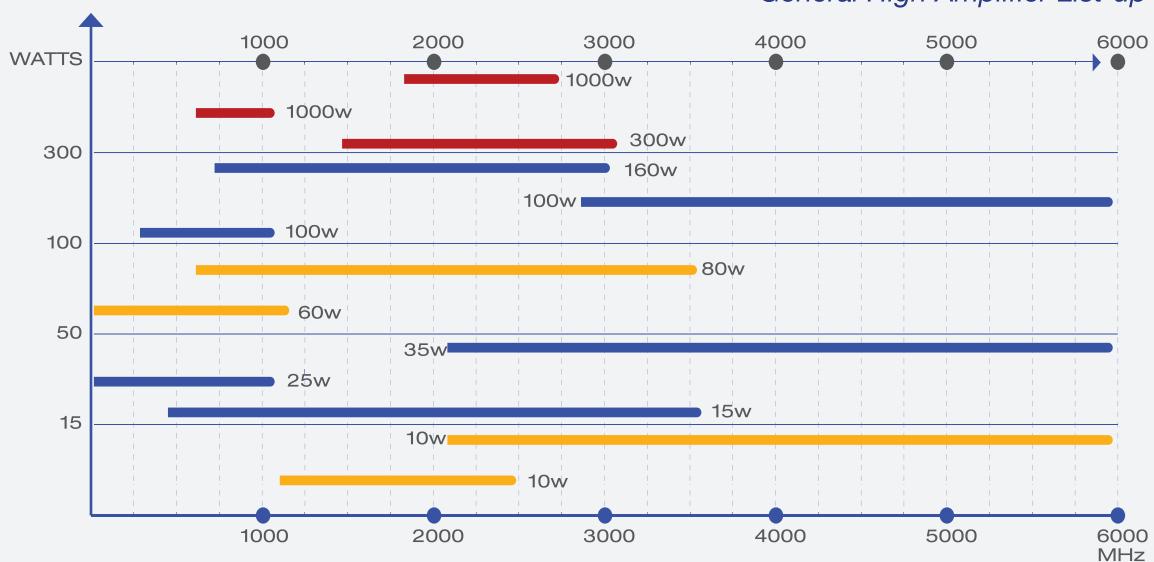

3. Application

- FM, AM, CW boosting
- Jamming system
- RF passive Test system
- RF Energy system

General High Amplifier List-up

NARROW HIGH POWER AMPLIFIER

The narrow HPA is suitable for signal boosting in telecommunication frequency ranges and normally, LDMOS device is used. It has high gain, wide dynamic range, low distortion and good linearity, as its main characteristics. It can be used as a normal signal boosting amplifier module which requires long-lasting reliability.

General High Power Amplifier

BROADBAND HIGH POWER AMPLIFIER

The broadband HPA is Sungsan's representative item and it can amplify signals with frequency bands higher than octave band. It can be an ideal solution for broadband mobile jamming, band-specific high power and specific frequency ranges. Thanks to the use of excellent power density GaN device, it covers broadband frequency ranges and has high efficiency at the same time. In addition, it has higher breakdown voltage characteristics compared to LDMOS. Therefore, it has better output power stability under low VSWR conditions.

Linear Amplifier

GENERAL DESCRIPTION

1. Characteristics

The linear amplifier lineup is ideal for use when various modulation signals need to be amplified. And it can also be a perfect solution for applications demanding high linearity from 400MHz to 3.8GHz. Various linearization technologies are applied to Sungsan's linear amplifiers and those are analog predistortion using predistortion IC, feedforward through the use of error amplifiers, IM cancellation with adaptive bias control. Analog predistortion technology is ideal when modulation signals of more than 1.5MHz bandwidth need to be amplified. Whereas, feedforward technology is suitable for multi-carrier signals such as GSM.

2. Main Features

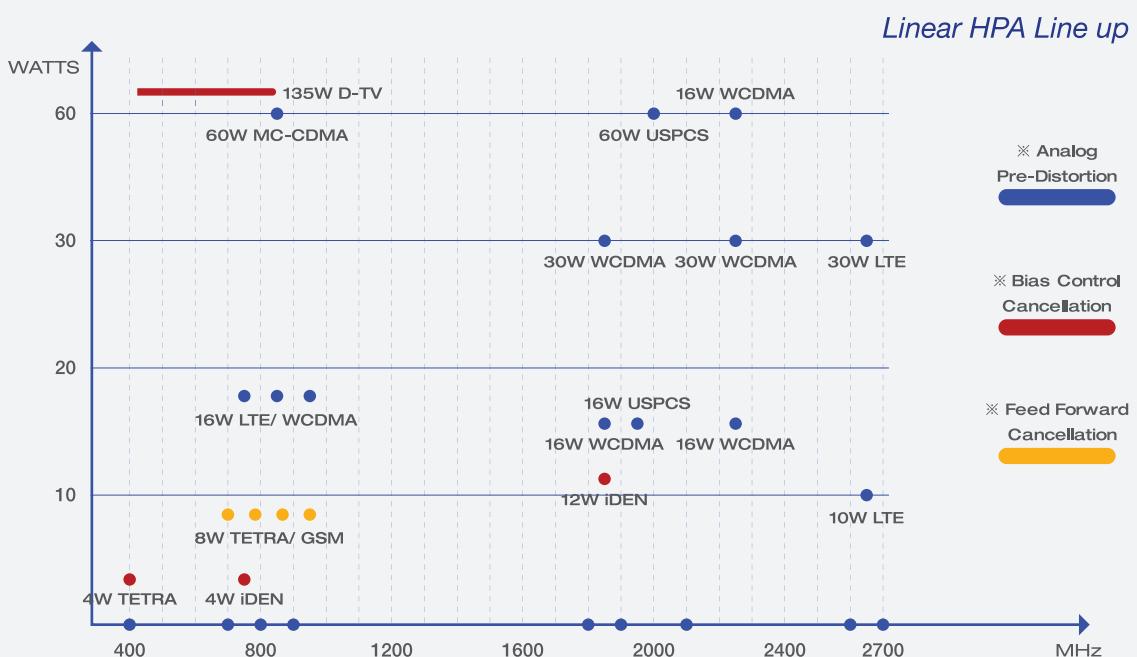

- In/out High Isolation
- Forward & Reverse Monitoring
- Current Monitoring
- Over temp. shutdown and Auto Recovery(option)
- Temperature Monitoring

3. Application

- LTE, WCDMA Signal Amplifier
- RF Repeater
- Distributed Antenna System
- Line Amplifier
- Amplifier for Digital Television

Special Purpose Amplifier for Accelerator

GENERAL DESCRIPTION

The heavy-ion accelerator is a device that provides energy by propelling charged particles such as electron, proton and ion. Working as a main partner in Korea's heavy-ion accelerator development project "RAON" since 2012, Sungsan has ample accelerator solutions which Sungsan has developed over the years. Those solutions include one with a maximum power of 80kW through the use of combiners for high power and heat removal method. Sungsan keeps playing their important role in Korea's various main plant projects.

Special Purpose Amplifier for EMC

GENERAL DESCRIPTION

EMC (ElectroMagnetic Compatibility) testing is a test to measure the electro-magnetic interference(EMI) caused by an electrical device and the susceptibility of a product to electromagnetic interference from other sources. For most electronic and electrical products, EMC compliance is mandatory. In February, 2015, Sungsan got orders from Korean EMC testing laboratories for 12 units of amplifiers for Specific Absorption Rate(SAR) source and for another 14 units of amplifiers for Radiated Susceptibility(RS) source
